

How To Play The Didgeridoo

How To Play The Didgeridoo

Downloaded from old.oplm.com by Callahan & Riley

THE ANCIENT ART OF THE DIDGERIDOO: A BEGINNER'S GUIDE

The didgeridoo is one of the oldest wind instruments on Earth, with a rich cultural heritage that stretches back tens of thousands of years. Originating from the Indigenous peoples of northern Australia, this long, hollow wooden instrument produces a deep, resonant, and captivating drone that seems to vibrate through the body itself. For many, the sound of the didgeridoo is not just music; it is a meditation, a storytelling device, and a connection to the land. If you have ever been mesmerized by its earthy hum and wondered **how to play the didgeridoo**, you are about to embark on a rewarding journey. Learning this instrument is less about reading sheet music and more about mastering your own breath, body, and rhythm. This guide will walk you through everything you need to know, from choosing your first didgeridoo to producing your first circular breath.

UNDERSTANDING THE DIDGERIDOO: MORE THAN JUST A HOLLOW LOG

Before diving into technique, it helps to understand what you are working with. Traditional didgeridoos are made from eucalyptus branches or trunks that have been hollowed out by termites. Modern versions can be made from PVC pipe, agave, bamboo, or even fiberglass. The instrument is essentially a resonant tube that amplifies the vibrations created by your lips. The length and shape of the instrument affect its pitch, with longer didgeridoos producing a deeper sound. While you can spend hundreds or even thousands of dollars on a handcrafted piece, beginners often start with a simple, affordable didgeridoo to learn the fundamentals of **how to play the didgeridoo** without a major investment.

Choosing Your First Instrument

For learning purposes, the best didgeridoo is the one you can actually play comfortably. Look for a mouthpiece that fits your mouth well—not too large and not too small. A diameter of around 3 to 4 centimeters is typical. Most importantly, ensure the instrument has a good seal at the mouthpiece so that air does not escape around your lips. If you are using a PVC didgeridoo, you can soften the mouthpiece edge with a little sanding or by adding a beeswax mouthpiece to create a comfortable seal. The goal at this stage is to remove any physical barriers that might frustrate your efforts to learn **how to play the didgeridoo**.

THE FOUNDATION: MAKING THE DRONE SOUND

The drone is the core sound of the didgeridoo. To produce it, you need to create a sustained vibration with your lips, similar to blowing a raspberry or buzzing your lips like a horse. It is the same basic idea as playing a brass instrument, but with a relaxed, open mouth.

Step-by-Step to Your First Drone

- Relax your face.** Tension is the enemy of a good drone. Let your jaw hang slightly loose.
- Press the mouthpiece gently against your lips.** Do not jam it against your teeth. The mouthpiece should rest on your lips, not inside your mouth.
- Make a buzzing sound.** Without the instrument, practice making a "brrr" sound with your lips. It should feel like a motorboat or a horse's whinny. Your lips should vibrate freely.
- Apply the buzz to the didgeridoo.** Place your buzzing lips to the mouthpiece and blow a steady stream of air. You are aiming for a continuous, steady vibration.
- Adjust your mouth shape.** If no sound comes out, try shaping your mouth as if you are saying "oo" or "oh." This opens the back of your throat and allows more air to flow. If the sound is too airy, try tightening the corners of your mouth slightly to focus the buzz.

It is common to get a sound for only a second or two at first. That is perfectly normal. The key to mastering **how to play the didgeridoo** at this stage is consistency. Practice holding that buzz for as long as you can, aiming for a steady pitch without squeaking. Once you can hold a drone for five to ten seconds, you have crossed the first major hurdle.

THE SECRET WEAPON: CIRCULAR BREATHING

This is the technique that defines didgeridoo playing and allows you to create a continuous, uninterrupted sound for minutes on end. Circular breathing might sound complex, but it is a skill that can be broken down into manageable steps. It involves storing air in your cheeks and then using that air to sustain the instrument while you inhale quickly through your nose.

Mastering Circular Breathing Step by Step

Many people try to learn circular breathing on the instrument and get frustrated. A better approach is to practice the mechanics away from the didgeridoo.

- Step 1: The Puff of Air.** Fill your cheeks with air (like a pufferfish). Keep your lips sealed, and then push the air out of your mouth using only your cheek muscles. You should be able to produce a steady stream of air for a few seconds. Do not use your lungs for this.
- Step 2: The Straw Exercise.** Get a glass of water and a straw. Fill your cheeks with air and push it through the straw to create bubbles. While bubbles are flowing from your cheeks, quickly inhale through your nose. Try to keep the bubbles constant. This mimics exactly what your body needs to do on the didgeridoo.
- Step 3: Cheek-to-Lung Transition.** The most important part of circular breathing is the transition. When you are pushing air from your cheeks, your lungs are empty and you are about to inhale. The moment you inhale through your nose, you must switch from pushing with your cheeks to blowing from your lungs. This transition should be seamless.
- Step 4: Apply to the Didgeridoo.** Once you can keep a straw bubbling continuously, return to your didgeridoo. Start your drone. As you feel your lungs running out of air, puff your cheeks out and begin pushing air from your cheeks. While doing this, quickly inhale through your nose. Then switch back to lung power. Your drone might wobble at first, but with practice, it will become smooth.

Circular breathing is often the most challenging part of learning **how to play the didgeridoo**, but do not be discouraged. Most people need several weeks of daily practice to get a reliable circular breath. The freedom it gives you, however, is immense. You will no longer be limited by the size of your lungs.

ADDING VOCALIZATIONS AND RHYTHMS

Once you have a steady drone and a basic circular breath, the real fun begins. The didgeridoo is not just a monotone instrument; it is a canvas for rhythms, animal sounds, and vocal effects. These sounds are created by modifying your voice, tongue, and throat while maintaining the drone.

Common Vocal Effects

- Pulse or "Stab" Sounds:** These are created by quickly pushing a burst of air from your diaphragm or throat while keeping the drone going. They sound like a rhythmic "huh" or "duh" layered over the drone.
- Animal Calls:** The most famous didgeridoo effect is the dingo howl or the kookaburra sound. You can create these by making a high-pitched "yoo" sound with your voice while you drone. Your vocal cords produce a second pitch that harmonizes or clashes with the drone pitch. Experiment with different vowel sounds and pitches.
- Tongue Rhythms:** Use your tongue to interrupt the airflow. Try saying "ta-ka-ta-ka" or "da-ra-da-ra" into the mouthpiece. The "ta" sound will produce a sharper, percussive effect, while "da" will be softer. This is a fundamental way to create syncopated rhythms.
- Belly Laugh Lift:** Imagine you are laughing from your stomach. This rhythmic pulsing of the diaphragm can create a "wobble" effect in the drone, which is excellent for dance rhythms.

When you first try to add vocalizations, your drone might break. That is expected. The goal is to learn to isolate your lips (which make the drone) from your throat and tongue (which make the effects). A great exercise is to practice saying "whooh" while holding a lip buzz. The "w" sound forces your throat to constrict rhythmically, which is the foundation of many didgeridoo rhythms.

Developing a Rhythm Vocabulary

Traditional Aboriginal playing often follows a structure that mimics the natural world—wind, water, animals, and walking. As you learn **how to play the didgeridoo**, you will develop your own rhythmic patterns. Start with a simple pulse: drone for four beats, then add a tongue "tah" on beat 2. Then try it on beat 4. Then try a pattern: drone, drone, "tah," drone. As you get comfortable, combine these with your circular breathing to create a seamless flow. Record yourself and listen back. It is amazing how quickly you can go from a simple drone to a complex, layered rhythm.

POSTURE AND BREATH SUPPORT

Your body is part of the instrument. How you hold yourself directly affects your sound. Sit on the edge of a chair with your back straight but not rigid. Hold the didgeridoo at a slight angle away from your body. The mouthpiece should come to your mouth, not the other way around. This keeps your throat open and allows for better airflow and easier circular breathing.

Breathing from the Diaphragm

Shallow chest breathing will limit your stamina and make circular breathing nearly impossible. You need to learn to breathe from your diaphragm. Place one hand on your belly. When you inhale, your belly should push outward. When you exhale, it should fall inward. This is the opposite of "sucking your gut in." Diaphragmatic breathing gives you massive air capacity and control. Practice this breathing pattern for a few minutes every day, even without the instrument. It is the foundation of all wind instrument playing, and it is essential for **how to play the didgeridoo** effectively.

COMMON CHALLENGES AND HOW TO OVERCOME THEM

Every beginner hits a few walls. Knowing these roadblocks in advance can save you frustration.

- Squeaking or Wavering Drone:** This usually means your lips are too tense or you are pushing too much air. Relax your jaw and try a gentler stream of air. Sometimes, a small adjustment in mouthpiece position makes all the difference.
- Dizziness:** If you feel lightheaded, you are likely hyperventilating. This is common when you first start circular breathing because you are taking in more air than you are used to. Stop, breathe normally, and return to practice when you feel steady. Your body will adapt over time.
- Inability to Circular Breathe:** Do not rush this step. Spend a week just doing the cheek-puff and straw exercises. Many people try to force circular breathing too early and develop bad habits. Master the transition with water first, then move to the didgeridoo.
- Saliva Build-up:** The didgeridoo is a wet instrument. Saliva will accumulate in the mouthpiece. Simply tilt the instrument down and let it drain, or gently blow it out. Some players use a small piece of cloth or a sponge in the mouthpiece to reduce this. It is a natural part of the instrument, so do not let it discourage you.

DEVELOPING YOUR UNIQUE STYLE

While it is valuable to learn traditional rhythms, the didgeridoo is also a modern instrument used in world music, electronic, and ambient genres. Once you have the basics of **how to play the didgeridoo**, feel free to experiment. Try playing it softly for a meditative hum, or loud and aggressive for a tribal dance feel. Use your voice to create melodies over the drone. Sing into the instrument while you play. The didgeridoo is incredibly forgiving and encourages personal expression. Many players eventually learn to "overblow" to produce higher harmonics, which adds another layer of melody. This is an advanced technique that comes once you have complete control over your drone.

CONCLUSION

Learning **how to play the didgeridoo** is a journey into breath control, rhythm, and deep listening. It is an instrument that rewards patience and daily practice. You do not need to be a musician to start; you just need a willingness to experiment and a
